
V4 Section Upgrade Plan

Making every section as premium as the Hero

The Hero and the Proof section are locked and loved. This plan drags every other section up to that same bar.

How to read this: Skim the **Scorecard** first to see where each section stands. Then read the section you want to fix — each one tells you *what it looks like now, what's good, what fails, the fix in plain words (with the exact photo/screenshot it should use), and what I need from you*. Approve the **Phases** one at a time; nothing ships without your green light.

Live files this plan touches: `madquick-clone/public/v3/index.html`, `madquick-clone/public/v3/styles.css`, `madquick-clone/public/v3/app.js` (your site on `localhost:5055/v3/`). Your real photos and screenshots already sit in `madquick-clone/public/images/`.

The Two Quality Bars (the rubric we copy)

Everything below must *feel* like the **Hero (#home)** and the **Proof scene (#proof-numbers)**. Here is exactly what makes those two premium, in plain words:

- **It leads with a real picture, not a paragraph.** The Hero opens on a real cut-out photo of you. The Proof scene opens on you + a real coded chart that draws itself. The eye lands on *something real* before it reads a single word.
- **The "floating metric card" look (the chok-chok).** Glass cards with: a soft **gold halo** glow behind them, a **left-to-right shine sweep** that glints across on entry/hover, a gentle **idle float**, and numbers that **count up** from 0. That combination is the signature "expensive" feel.
- **The section presents itself as you scroll in.** Pure-CSS scroll-driven motion (`animation-timeline: view()`): the *person/photo resolves first, the copy lands last*. No scroll-snap, no jerk — it glides. One signature move per section, nothing busy.
- **Soft over hard, hairline over heavy.** Photo bottoms fade out (masked), ribbon edges fade out, dividers are thin gold hairlines — never thick boxes or hard cut lines. Dark + gold everywhere; **money-green only on a growth number**.
- **Only real numbers.** 3.78M views, +436.5% reach/90d, 400+ articles, 36+ companies, +117% clicks / +114% impressions, #1 wedding venues Kolkata. Decorative shapes never pretend to be exact data.

The glow rule (hard-won, do not break): a photo's gold glow is ONE soft radial-gradient *behind* the cut-out. Never a drop-shadow rim (it traces the rectangle and makes a box), never a blurred photo copy. Keep photos `overflow: visible`.

The Golden Rule (the pass/fail test for every section)

"A box and writing with NO PIC in that section is a very, very bad AI-generated website —

not 1% of the quality we built."

So the test for **every** section is one yes/no question:

Is this section built around a real visual — a photo, a screenshot, a real coded chart, or a designed composition?

- **YES** → text is allowed to live *inside* that visual composition. Pass.
- **NO** (it's just rectangles of text — cards, columns, lists, chips — even with pretty glass and glow) → **FAIL**. Decorative icons, ghost numerals, and CSS glows do **not** count as a real visual.

Scorecard

Section	Grade	Real visual?	Golden-rule verdict	The one biggest problem
Services — "Services built on proof" (#services)	3 / 10	✗ No	FAIL (worst offender)	9 identical text-and-icon boxes that <i>promise</i> proof but show none — the textbook "AI features grid"
Case Studies (#proof-numbers .proof__cases)	3 / 10	✗ No	FAIL	3 text-only glass cards (name + word-metric + paragraph + chips), zero imagery, sitting right under the gorgeous Proof marquees
Selected Work / showcase (#work)	8 / 10	✓ Yes	PASS	Already near the bar; 4 of its 6 screenshots need privacy anonymizing before public launch
About Me (#about)	4 / 10	⚠ Partial	FAIL (half the section)	Left = recycled hero photo (banned); right = a lonely text column; whole panel is off-brand violet, not dark+gold
Process — "A proof-driven process" (#process)	3 / 10	✗ No	FAIL	6 numbered text cards; the premium scrubbing stepper is fully built but dead (never switched on)
Contact (#contact)	3 / 10	✗ No	FAIL	One big centered text box with glows — the most template-looking, most AI-looking block on the page, no face at the moment trust matters most

Selected Work proves the bar is reachable in this codebase — it's the model the other five should copy.

Section-by-section plan

1. Services — "Services built on proof" (`#services`) — TOP PRIORITY

What it is now. A centered header ("Services built on proof") over a horizontal-scrolling row of **9 identical glass cards** (SEO Strategy, Content Writing, Content Marketing, Social Media, WordPress Publishing, AI & No-Code, Video Editing, Analytics & Reporting, Canva Design). Every card is the same recipe: a thin line-drawn SVG icon (magnifying glass, pencil, speaker...), a title, one sentence. Nice per-card touches — pointer-following gold glow, 3D tilt, gold sheen — but **not one photo, screenshot, or chart anywhere**. (Note: the gold prev/next arrows are now actually wired in `app.js`, so the carousel works — the older audit said they were dead; that's fixed.)

✅ **What's already good** - Headline is already your target line: "Services **built on proof**" with the gold gradient. - Premium glass surface + gold hairline + per-card glow/tilt are real and on-brand. - Fully responsive and accessible (role=list, reduced-motion + touch fallbacks), arrows now functional.

❌ **What fails the bar** - **No real visual at all** — 9 text+icon boxes are *exactly* the banned "AI features grid." - The copy promises proof ("documented, measured, repeatable across 36+ companies") while the cards deliver **zero proof** — no number, no screen, no artifact. It contradicts its own headline. - All 9 weighted equally — no signal of your strongest disciplines (SEO/content, where the 400+ articles and #1 rankings live). - No signature "presents itself" entrance like Hero/Proof; just a generic reveal.

The modern fix — concrete layout idea. Stop building a grid of glyphs. Build a **"signature 3 + supporting strip"** that leads with you and proves each service with a real screen:

- **Anchor the whole section on a real photo of you working.** Use the **candid MacBook cut-out** (`/images/abhijit-macbook.png`, already on disk, currently unused) on the left with a soft gold halo behind it — so the section opens on a *human at his craft*, not icons.
- **Promote 3 "signature" service cards** (your strongest, the ones with real numbers) into **large proof tiles**, each LED by a real screenshot instead of an icon:
- **SEO Strategy** → `work-seo-strategy.png` (the keyword matrix) + stamp **"#1 ranked wedding venues, Kolkata"**.
- **Content Writing** → `work-wordpress-blogs.png` (the publish tracker) + stamp **"400+ articles"**.
- **Analytics & Reporting** → the GSC chart (the +117% clicks / +114% impressions data) + stamp **"+436.5% reach / 90d"** in money-green.
- **Demote the other 6** (Content Marketing, Social Media, WordPress Publishing, AI & No-Code, Video Editing, Canva Design) into a **slim secondary strip** of small calm tiles — present, but clearly supporting. That hierarchy + negative space is what reads premium instead of a flat 3×3 wall.
- Borrow the chok-chok: each signature tile gets the gold halo + shine-sweep on its screenshot, and any numeric stamp **counts up**.

The ONE signature motion. As the section scrolls in: your working photo **resolves first**, then the 3 signature proof tiles **settle and shine-sweep in sequence**, copy last — same `animation-timeline: view()` choreography as Proof. Keep the now-working carousel for the supporting strip only, with **mask-faded edges** so cards ramp out softly instead of hard-cutting.

Assets I need from you - ☒ Already have: `abhijit-macbook.png/.webp`, `work-seo-strategy.png`, `work-wordpress-blogs.png`. - The **GSC screenshot or CSV** for the Analytics tile (the +117% / +114% chart) — or confirm I should render it as a coded mini-chart from the real numbers. - **Privacy call:** confirm `work-seo-strategy.png` and `work-wordpress-blogs.png` are safe to show, or which client names/data to blur first. - Confirm the 3 "signature" picks (I propose SEO, Content Writing, Analytics).

2. Case Studies (`#proof-numbers .proof__cases`) — TOP PRIORITY

What it is now. A 3-column grid of glass cards (Ymedia, RuDe Labs, Pursueit Dubai). Each is **pure text**: client name + role, a big word-metric ("33 articles · 30 days", "100+ videos optimized", "International SEO + Social"), a clamped paragraph, little tool pills (WordPress, SEMrush...), and a "Visit →" link on two of three. **Zero images, charts, or designed graphics** in the whole block — confirmed. The "01/02/03" corners are just text numerals. It sits *directly under* the beautiful Proof marquees, so the quality drop is jarring.

☒ **What's already good** - Honest, well-written scope per client ("no rounding up" tone). - Premium glass + hairline + tilt finish; already slimmed per earlier feedback.

☒ **What fails the bar** - **No visual in any of the 3 cards** — straight golden-rule failure, the most AI-looking block right after the best one. - The big "metrics" are inconsistent and non-numeric ("International SEO + Social"), so they read as filler and can't even use the count-up treatment. - Uneven row: RuDe Labs has no "Visit" link while the others do. - It **duplicates** the Selected Work story (Pursueit, SEO, WordPress, social all appear in both) — but with text instead of the real screenshots Selected Work already shows.

The modern fix — concrete layout idea. Two honest options; I recommend **B**:

- **Option A — give each card a real visual top** (match Selected Work's device-frame look): drop a real screenshot into a browser/phone frame at the top of each card. Ymedia → an article/tracker thumbnail; RuDe Labs → a YouTube channel screenshot showing optimized titles; Pursueit → the Dubai blog page or `work-seo-strategy.png`. Where no clean screenshot exists, **make the number the visual**: a small real coded mini-chart (e.g. 33 articles shown as 33 tiny stacked bars) — illustrative shape, never a fake exact value. Add the chok-chok: gold halo + shine-sweep + count-up on the real numbers, normalize every card to a real comparable number, and give every card the same "Visit →" treatment.
- **Option B (recommended) — fold Case Studies INTO Selected Work and delete the text cards.** Selected Work already proves Pursueit / WordPress / social with real screenshots. Add Ymedia and RuDe Labs as **two more screenshot cards** in that stream, then remove the lonely text block entirely. This kills the weakest, most-AI block *and* the duplication in one move — cleaner and faster than dressing up text cards.

The ONE signature motion. Whichever option: the **visual resolves first, copy second**, using the same scroll-driven entrance as Proof — no generic reveal fade.

Assets I need from you - A real screenshot per case (if keeping Option A): Ymedia article/tracker; a RuDe Labs YouTube page; Pursueit blog page (or reuse `work-seo-strategy.png`). - If no screenshot exists for a card, the **single real number** for it (exact article count, exact #videos optimized) so it

becomes a coded mini-chart. - **Your decision: A or B.** (I lean B.) - The correct real big-number per case so a count-up makes sense.

3. Selected Work / showcase (#work) — the model to copy

What it is now. The strongest non-hero section: a pinned sticky narrative on the left (live "01 · 06" counter + gold progress bar) while a stream of **6 real screenshots** scrolls past on the right, each in a designed device frame — browser windows with traffic-light dots (`work-seo-strategy.png` , `work-wordpress-blogs.png` , `work-social-influencer.webp` , `work-social-calendar.webp` with a picture-in-picture brand inset), a real **phone frame** for the BaliHans app (`work-app-balihans.webp`), and a featured "My own page" ribbon card with the **3,783,817-views** Bongbari screenshot (`bongbari-proof.jpg`).

✅ **What's already good** — Essentially at the bar: real screenshots in real frames, native aspect ratios (no cropping), and a true signature motion (pinned narrative + active-item swap + cross-fading blurb + counter + progress fill) with a clean reduced-motion fallback.

❌ **What fails the bar** — Only one real risk: **4 of the 6 screenshots show real client data/faces** and must be anonymized before public launch.

The modern fix — Leave the design alone. Just **anonymize the 4 privacy-flagged shots** (blur client faces/handles/data). If we adopt Case Studies **Option B**, add Ymedia + RuDe Labs here as two more frames.

Assets I need from you — The privacy call on the 4 shots, plus (if Option B) Ymedia + RuDe Labs screenshots.

4. About Me (#about)

What it is now. A two-column split. **Left** = a portrait in a tall frame with a violet placeholder, violet bottom glow, an "Available for work" pill, and a "25 · Based in India · Working worldwide" caption. **Right** = pure text: eyebrow, headline "Real work. Real proof.", a 3-paragraph bio, 4 outline stat chips (5+ Years / 3 Countries / 36+ Companies / Dubai to USA), two buttons. The photo on the left is **the recycled hero file** (`/images/abhijit-hero-v6.png` , line 929 — byte-identical to the hero) which the brief explicitly bans.

✅ **What's already good** - It's at least photo-led on the left (a real face, not clip-art). - Motion engineering is premium-grade (scroll-driven with graceful fallback, fully reduced-motion safe). - Copy is honest; chips already de-loud-ified into hairline outline pills.

❌ **What fails the bar - Recycled hero headshot** — the single most explicit instruction here is unmet, and a real candid already exists unused (`/images/abhijit-macbook.png`). - **Right half is a lonely text column** — golden-rule failure for half the section. - **Off-brand violet/indigo/lime** — About is the lone purple island on a dark+gold site. - No gold halo + shine-sweep + idle float on the portrait; three competing motions instead of one signature move; stats are flat text chips, not a count-up data-viz.

The modern fix. - **Swap to the candid MacBook cut-out** (`/images/abhijit-macbook.png`) — instantly reads as "here's me actually doing the work," not the hero copy-pasted. Clean cut-out on a soft **gold** halo (radial-gradient only — the glow rule), masked bottom fade. - **Re-skin violet** → **dark+gold**. Drop the violet placeholder and "text-violet"/"text-lime" accents; give the photo the family's gold halo +

shine-sweep. - **Kill the text column:** turn the 4 stats into **floating glass metric cards** (5+ yrs · 36+ companies · 3 countries) over/beside the photo, with the Proof-style **count-up**. Now the section leads with a visual composition. - **Cut the bio** from 3 paragraphs to ~2 tight lines that overlap the photo/cards — text inside the picture, never a standalone box.

The ONE signature motion. Candid photo resolves first → stat cards count up → short copy lands last. Drop the separate headline-wipe + chip-pop so it's one confident move.

Assets I need from you - ☒ Already have: `abhijit-macbook.png/.webp` (run through rembg if you want a cleaner cut-out — say the word). - Optional: one privacy-safe screenshot to layer as a second proof object (e.g. the GSC chart). - Confirm the 3 numbers to surface (5+ years, 36+ companies, 3 countries) and whether to add a green growth figure here.

5. Process — "A proof-driven process" (`#process`)

What it is now. Six numbered glass cards (01 Understand → 06 Document the proof) down a thin centered gold rail, each just a heading + one sentence, with ghost outline numerals behind. **No image, screenshot, chart, or logo anywhere.** Critically: the **premium scrubbing pinned stepper is fully built but switched OFF** — the JavaScript looks for an element marked `[data-stepper]` (`app.js` line 1242) and that marker **doesn't exist in the HTML**, so the fancy experience never runs. What visitors get is a flat static list, and steps only light up on mouse-hover (dead on phones).

☒ **What's already good** — Six honest, well-written steps; consistent dark+gold styling; the rail progress-fill works; and the entire scrubbing-stepper design is **already coded** in CSS and JS (it just needs to be turned on); reduced-motion fallbacks are handled.

☒ **What fails the bar - No real visual in any step** — golden-rule failure. - The signature motion is **dead code** (missing `[data-stepper]` marker + the wrapper element the CSS expects). - "Proof-driven" is claimed but never *shown* — tools (SEMrush, RankMath, Analytics, Meta, WordPress) are bare words, no logos, no screens; step 06 literally promises proof the section never displays. - Active state is hover-only → flat and dead on mobile. No closing real metric.

The modern fix — "working desk" scene. Make it two panels: - **Left:** the real MacBook cut-out (`/images/abhijit-macbook.png`) on dark+gold glass with a soft radial glow. - **Right:** the six steps. As you scroll, the active step lights gold **and the left visual swaps to the real artifact for that step** — so every step is anchored to something you can see: step 02 → `work-seo-strategy.png` (keyword/SEMrush), steps 03–04 → `work-wordpress-blogs.png`, step 05 → the GSC/Analytics chart, step 06 → a mini Proof card reusing **3.78M views / +436.5% reach**. - **Turn the signature motion ON:** add the missing `data-stepper` marker + wrapper so the section pins and the steps scrub active↔dim with a "Step N / 6" counter — and trigger on **scroll position, not hover**, so it works on phones. - Show the tools as small **monochrome-gold logo chips** inside the relevant step, and end step 06 with one **money-green metric lockup** so the process visibly pays off.

The ONE signature motion. The scroll-driven scrub (already built) — left visual swaps per active step, counter advances, rail fills.

Assets I need from you - ☒ Already have: `abhijit-macbook.png`, `work-seo-strategy.png`, `work-wordpress-blogs.png`, `bongbari-proof.jpg`. - The **GSC chart/CSV** for step 05. - Logo marks

(monochrome/gold) for SEMrush, RankMath, Google Analytics, Meta Business Suite, WordPress — or confirm I source clean ones. - Privacy call on the screenshots used here.

6. Contact (`#contact`)

What it is now. A single centered glass box: eyebrow, big headline (restating the services list a 4th time), a lead paragraph, two side-by-side buttons (WhatsApp + Contact Me), an email line, and three text "assurance" chips ("Reply within 24 hours", "Work directly with me", "Proof-backed, not promises"). Behind it: a drifting aurora glow, grain, gradient hairline, panel tilt, magnetic buttons. **No photo, screenshot, chart, or designed visual** — just two tiny button icons. It's the most template-looking block on the page, at the exact moment trust matters most.

✅ **What's already good** — Real working actions (WhatsApp `wa.me/918777849865`, mailto `growabhijit@gmail.com`, LinkedIn), on-brand dark+gold, and the magnetic-CTA + tilt interactions already exist and are reduced-motion safe. Solid accessibility.

❌ **What fails the bar** - **No human face** at the close — Hero and Proof both lead with you; the closing section shows nobody. - **No real visual of any kind** — one text box dressed in glow. Golden-rule failure. - Two competing CTAs; centered/symmetric layout (not premium-editorial); the 3 "assurances" are unverifiable text claims on a *proof-first* site. - Doesn't use the locked motions (no shine-sweep, no count-up, no `view()` entrance) — heavy decorative glow piled on emptiness.

The modern fix. - **Lead with your face.** Real cut-out (a warm headshot, or the MacBook shot) on the left; copy + **one** magnetic CTA on the right (two-column desktop, stacked mobile). Same soft gold halo + masked bottom fade as Hero/Proof. - **Collapse to one hero CTA:** make **"Chat on WhatsApp"** the single big gold magnetic button (with the shine-sweep); demote email + LinkedIn to quiet text links beneath. - **Turn the 3 word-assurances into a tiny real proof ledger** — small count-up tiles reusing already-verified numbers (**3.78M views · 36+ companies · 3 countries**). Even the close shows proof, not promises. No new assets needed. - Replace the centered box with an **asymmetric editorial composition** (photo bleeding to one edge, soft fade, copy in negative space); calm the aurora down to one quiet halo so the face is the hero.

The ONE signature motion. Same `view()` entrance as Proof: photo resolves first, copy + CTA settle last.

Assets I need from you - A real cut-out for the close (warm headshot or MacBook shot — I can reuse what's on disk). - Which CTA is primary (I propose WhatsApp). - Confirm the 2–3 numbers for the closing ledger.

Phase-wise execution plan

Ordered by impact. Each phase stands alone — you review and approve before the next. Each bumps the `styles.css` version so your Chrome pulls fresh styles (otherwise fixes "don't work" for you), and I verify on your real Chrome, not just the headless preview.

Phase 1 — Services becomes "proof you can see" (TODO — highest impact)

- **Goal:** Kill the single worst golden-rule offender. Turn 9 icon-boxes into a photo-anchored "signature 3 + supporting strip."
- **Steps:** place the candid MacBook photo as the anchor → build 3 large proof tiles led by `work-seo-strategy.png`, `work-wordpress-blogs.png`, and the Analytics chart, each stamped with a real number (one money-green) → demote the other 6 to a slim masked-edge strip → add the `view()` entrance + shine-sweep.
- **What you'll see when done:** the section opens on *you working*, three big tiles each showing a real screen + a counting-up real number, and the rest as a calm supporting row — no naked icon grid.
- **Touches:** `#services` in `index.html/styles.css/app.js` · assets: macbook + 2 screenshots (have), GSC chart (need).

Phase 2 — Case Studies: fix or fold (TODO — highest impact)

- **Goal:** Remove the text-only block under the Proof marquees.
- **Steps:** if **Option B** (recommended) — add Ymedia + RuDe Labs as two screenshot frames inside Selected Work, delete the text cards. If **Option A** — give each card a real screenshot top (or a coded mini-chart of its real number), normalize metrics, even up the "Visit →" links, add halo + shine + count-up.
- **What you'll see when done:** no more lonely text cards; the case stories are told with real screens, and the duplication with Selected Work is gone.
- **Touches:** `#proof-numbers` `.proof__cases` (+ `#work` if Option B) · assets: per-case screenshots/numbers (need) + your A/B decision.

Phase 3 — Process: turn the dead stepper ON + anchor every step in a real screen (TODO — big "wow", low risk; the motion is pre-built)

- **Goal:** Activate the already-coded scrubbing stepper and make every step show a real artifact.
- **Steps:** add the missing `data-stepper` marker + wrapper so `initProcessStepper` runs → make the left visual swap to the real screenshot per active step → switch active-state trigger from hover to scroll (works on phones) → add monochrome-gold tool logos → close step 06 on a green metric lockup.
- **What you'll see when done:** the section pins and walks the visitor through your method step by step, each step showing the real screen that proves it, with a "Step N / 6" counter — working on desktop *and* mobile.
- **Touches:** `#process` in `index.html/styles.css/app.js` · assets: macbook + screenshots (have), GSC chart + tool logos (need).

Phase 4 — About: candid photo, dark+gold reskin, floating stat cards (TODO)

- **Goal:** Replace the recycled hero photo, kill the text column, end the violet island.
- **Steps:** swap to `abhijit-macbook.png` on a gold halo → reskin violet→dark+gold → convert the 4 text chips into floating count-up metric cards → trim bio to ~2 lines over the composition → one `view()` motion.

- **What you'll see when done:** a fresh "me at work" moment in dark+gold, numbers that count up beside the photo, almost no standalone text.
- **Touches:** `#about` · assets: macbook (have), optional second screenshot.

Phase 5 — Contact: a human close with one CTA + a proof ledger (TODO)

- **Goal:** Replace the AI text-box with a face-led editorial close.
- **Steps:** add the cut-out photo (gold halo) → collapse to one magnetic WhatsApp CTA, demote the rest → turn the 3 word-assurances into a count-up proof ledger (3.78M · 36+ · 3 countries) → asymmetric layout → one `view()` entrance, quiet the aurora.
- **What you'll see when done:** a warm, confident close — your face, one clear button, real numbers — instead of a glowing empty box.
- **Touches:** `#contact` · assets: one cut-out (have) + primary-CTA confirmation.

Phase 6 — Privacy pass + final polish (TODO — must finish before public launch)

- **Goal:** Make every real screenshot safe to publish, then sweep for finish.
- **Steps:** anonymize the 4 privacy-flagged shots (blur faces/handles/client data) everywhere they appear (Selected Work, Services, Process, Case Studies) → final pass for masked edges, hairlines, consistent gold halos, count-up timing, reduced-motion + mobile checks.
- **What you'll see when done:** every screenshot is launch-safe, and all six upgraded sections feel like one premium family.
- **Touches:** all sections using screenshots · assets: your privacy call.

Already DONE (the locked bar): Hero (`#home`), Proof scene (`#proof-numbers` — graphs + count-up + chok-chok + `view()` entrance), and Selected Work (`#work`) design. Everything in Phases 1–6 is **TODO**.

Decisions & assets I need from you

Decisions - Case Studies: Option **A** (give each card a real screenshot/mini-chart) or Option **B** (fold into Selected Work and delete the text cards)? *I recommend B.* - **Services:** confirm the 3 "signature" services to feature — I propose **SEO Strategy, Content Writing, Analytics.** - **Contact:** primary CTA = **WhatsApp** (recommended) or email? - **Privacy:** which of the 4 flagged screenshots can I show as-is, and which client names/faces/data must I blur first? Nothing public-facing ships until this is settled.

Photos (✅ = *already on disk in* `madquick-clone/public/images/`) - ✅ `abhijit-macbook.png/.webp` — the candid "at the Mac" cut-out (currently unused; the star of Services, Process, About). - ✅ `abhijit-hero-v6.png` — keep for Hero only; stop reusing it in About. - Optional: a warm headshot for the Contact close (or I reuse what's on disk).

Screenshots (✅ = *on disk*) - ✅ `work-seo-strategy.png`, `work-wordpress-blogs.png`, `work-social-influencer.webp`, `work-social-calendar.webp`, `work-social-brand.webp`, `work-app-balihans.webp`,

bongbari-proof.jpg . - **Need:** Ymedia (articles/tracker) and a RuDe Labs YouTube page — only if Case Studies Option A, or for the Option-B folding.

GSC data - The **Search Console screenshot or CSV** behind +117% clicks / +114% impressions — needed for the Services Analytics tile and Process step 05 (or confirm I render it as a coded mini-chart from the real numbers).

Logos - Monochrome/gold marks for **SEMrush, RankMath, Google Analytics, Meta Business Suite, WordPress** for the Process tool chips — or confirm I source clean ones.

Numbers (all already verified — I will not invent any): 3.78M views · +436.5% reach/90d · 400+ articles · 36+ companies · 5+ years · 3 countries · +117% clicks / +114% impressions · #1 ranked wedding venues, Kolkata.
